

Video 0 – Intro to the App

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This video will focus on **explaining what Geminiman WearOS Manager is.**

First of all, it is a powerful ADB tool, created back in 2022, as an expansion of SHM MOD Companion. and over the years it kept growing, maturing to have more features and be more stable...

I have built the app in a way to reduce input entry to make things more convenient and to have accessibility support for those who are vision impaired...

Before I start. just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

When you open the application. you will be at the home tab. Here you can change the language (if the current language is not very clear. due to the use of Google Translate). Also you can scroll down to see ways of contacting me and browse all of the content I made on the Play Store through "Geminiman Apps and Watchfaces" ...

Moving on to the Guide. in here you will find a collection of Geminiman WearOS Manager Tutorials, and the video you are watching is called "Intro to the App"

Next is the WearOS Manager Tab, where most ADB operations are performed, and each part will have a video tutorial to make it easy for you to follow...

Right after. you will see the Logcat, it is mainly used for viewing watch logs live and saving them. It also allows you to view saved logs shared by someone who used the app.

Then comes Settings. It has few configurations that you can adjust according to your needs. Moreover, you can import or export preferences ...

Next would be the "Support Me" tab. This is where you can support me as a developer and sole maintainer of the app. Thanks in advance to everyone who does...

And finally, Permissions. As I believe in transparency, I want to make sure that each permission in the application is clear.

As I've mentioned in the beginning. every tab and section will have an explanatory video of its own.

And that will be all! If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything I publish is completely free, with no ads. So your support is highly appreciated.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Geminiman

Video 1 – How to Pair?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the first video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **“How To Pair – Wireless Debugging”**.

If you have successfully paired your watch with the phone, you can skip this part and watch the second video **“How To Connect – Wireless Debugging”**, unless you are facing any connectivity issues...

Before I start. Just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

WATCH

On your watch, go to settings, then connections. Open WI-FI and connect to the network your phone is on or connect to your phone Hotspot directly. I will be connecting to my phone hotspot.

Once done, go back to settings. Scroll down to about watch, then software information, tap on software version until you see “Developer Mode turned ON”,

go back to settings, at the very bottom you will see Developer Options, tap on it, and scroll down, enable ADB debugging, scroll down again and tap on Wireless Debugging,

you can wait a bit or tap like I do until it turns on, it takes time because the watch is choosing random ports to open,

once it is on, you will see a prompt to allow this network to connect always or once, if it is your own network, select always and allow...

now, scroll down and you will see IP address and port number to connect, write them down if you prefer manual connection input,

tap on “pair new device”, write down the pairing code and port number ...

Do not exit the pairing screen.

PHONE

Open the app and go to the WearOS Manager tab, press on the connect, you have two ways to pair, automated and manual, the application will connect immediately after a successful pairing...

AUTO

For Auto Method enter the IP Address and pairing Code and press connect, make sure watch screen is active and on pairing screen, enjoy the cat animation while the phone scans and identifies pairing and connecting ports...

once found, the phone will pair and you will see a pop-up message to confirm the connection, press ok and you are connected...

MANUAL

For Manual method, uncheck “detect ports“. Now enter the IP address. Connecting port, pairing port and pairing code and press connect. Make sure the watch screen is on and on the pairing screen. The phone will pair and you will see a pop-up message to confirm the connection, press ok and you are connected...

TROUBLESHOOT

- if you paired in the past with a different application on the phone, apps do not share pairing keys, you are required to pair again for each new application. pairing for the same app several times will simply replace the app key.
- Sometimes the app connection is stuck. This is not an issue with the app itself but the ADB is waiting for a response. You can replicate the problem by typing the ADB pair command on your PC terminal while the watch screen is off or not on the pairing screen, ADB will hang for some time till it times out...

To solve this problem, consider using a different network or simply restarting the phone and watch. You can also try to revoke authorizations on your watch to recreate ADB keys. All these can help in solving the issue. Keep in mind that a home network router might have a built-in Firewall that can interfere with the ADB connection. If you are using your phone hotspot, make sure VPN is off...

DONE

And that's it for **How To Pair – Wireless Debugging!**

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing** it with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything I publish is completely free, with no ads. So your support is highly appreciated.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Video 2 – How to Connect?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the second video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **“How To Connect – Wireless Debugging”**.

If you have not paired your watch, facing connection issues, or are not familiar with developer options, please go back to the first video **“How To Pair – Wireless Debugging”** ...

Before I start. just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

WATCH

Go to settings. Scroll to the bottom, you will see Developer Options. Tap on it, and scroll. Enable ADB debugging, scroll more and tap on Wireless Debugging,

You can wait a bit or tap like I do until it turns on. It takes time because the watch is choosing random ports to open.

Once it is on, you will see the IP address and port number to connect. write them down if you prefer manual connection input,

PHONE

Open the app and go to the WearOS Manager tab. Press on the connect. There are two ways to connect, automated and manual...

AUTO

For automated method, Enter the IP Address and press connect. Make sure the watch screen is active and is on “wireless debugging” screen. Enjoy the cat animation while the phone scans and identifies the connecting ports...

Once found, you will see a pop-up message to confirm the connection. Press proceed and you are connected...

Manual

For manual method, Uncheck the “detect ports“. Enter the IP address and Connecting port. Then press connect. Make sure the watch screen is active and is on “wireless debugging” pairing screen. You will see a pop-up message to confirm the connection. Press OK and you are connected...

Tips

Here are few tips for you to know

- Old WearOS Watches use Debug over Wi-Fi, which requires only an IP address, although there is a chance that Wireless Debugging is supported. Debug over Wi-Fi was replaced by Wireless Debugging in the new WearOS Watches...
- To Debug over Wi-Fi, you will only need to keep the watch screen active and be on the lookout for a notice to allow incoming connection. Once you have granted that, the phone has successfully connected to the watch...
- Wireless Debugging requires you to keep the watch screen active during the connecting or pairing process. Do not exit the Wireless Debugging screen to prevent the watch from entering doze state (that's when the watch is in idle state and most services are halted to preserve battery)...

Troubleshoot

- Sometimes the app connection is stuck. This is not an issue with the app itself but the ADB is waiting for a response. You can replicate the problem by typing the ADB connect command on your PC terminal while the watch screen is off or not on the wireless debugging screen, ADB will hang for some time till it times out...

To solve this problem, consider using a different network or simply restarting the phone and watch. You can also try to revoke authorizations on your watch to recreate ADB keys (you will be required to pair). All these can help in solving the issue. Keep in mind that a home network router might have a built-in Firewall that can interfere with the ADB connection. If you are using your phone hotspot, make sure VPN is off...

And that's it for **"How To Connect – Wireless Debugging"**!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything I publish is completely free, with no ads. So your support is highly appreciated.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Video 3 – How to view Watch Apps?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the third video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **How to view Watch Apps**.

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

First, make sure Geminiman WearOS Manager is installed on your watch beside your phone. You can check that by opening the app on your phone, on the home screen tab, press on "view the manager app on the watch playstore". install it if it's not installed. Now go to the WearOS Manager tab. There you will see a button "Detailed View of the Watch Apps".

If you have ADB connected to the watch, you will see a basic list of watch apps with minimal details. tap on clear and pull a new list. patiently wait as the phone signals the watch to pack and compress all apps' info and send it back to the phone...

If you are using the app for the first time, the phone will signal the watch to pack and compress all the required info and send it back to the phone, so patiently wait for the process to complete...

You can speed up the process by keeping the watch screen active. It might take up to a minute. Once done, you will see a pop-up dialog on your phone with all the watch apps installed and their details...

If you installed new apps, you can press the refresh list. the phone will signal the watch to only pack and compress what is new...

Well, that's it for "**How to view Watch Apps**"!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—**as a developer who dedicates free time to creating apps and watchfaces, everything I publish is completely free, with no ads**. So your **support is highly appreciated**.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Video 4 – How to backup and restore?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the fourth video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **How to backup and restore Apps**.

Usage

- Backups are mainly used for non-play store apps, known as sideloaded apps...
- You can organize the backups by selecting the apps and naming the backup with a meaning, such as watchfaces, games, media, and so on...
- When you want to share several apps with friends, it's better to share via backup, they can import your backup and restore it...

Starting

Before I start. just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

Let me open the app and connect to my watch,...

After the watch is connected, press the backup/restore button

Backup

Choose Backup, Then select the apps you want to backup. After that you can either choose to only backup or save the backup list before performing the backup itself. This is handy if you want to backup only specific apps and not all of them, You can keep the default backup folder name (or enter a custom one such as watchfaces or games, etc). Confirm. ...

Wait for the app to perform ADB pull. You can see the messages in logs for detailed info about every pull. Once done, the backup is complete...

Restore

Choose restore. Pick the backup you wish to restore. Select the apps you want to restore, and confirm...

Wait for the app to perform ADB install. You can see the messages in logs for detailed info about every install. Once done, the restore is complete...

Tips

- If you notice any Error, long press and search google for the error. However, if the app shows Error without anything specific, do reach out to me, so I can adjust the code to print out more details about it. The error does not indicate app issues, rather, watch rejecting the app for security or APK related problems...

- if you do not configure auto export backups, you need to export them manually, otherwise, all backups are lost when you uninstall the application...

And that's it for **How to backup and restore!**

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything **I publish is completely free, with no ads**. So, your **support is highly appreciated**.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Geminiman

Video 5 – How to Disable/Enable?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the fifth video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **How to Disable/Enable**.

Usage

- Disabling apps is aimed at turning off apps and services that you don't want them running on your watch in hopes to extend the watch battery life...

Starting

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

Disable

After the watch is connected, press the Disable/Enable button. Understand the message shown that Android OS can re-enable apps you disable. Proceed and choose Disable. Select the apps you want to disable. Make sure you know what you are doing! After that you can either choose to disable only or save the disabled list before performing the disable. This is handy if you have a specific list of apps you want to always disable when you get a new watch or after you reset your current watch...

Wait for the app to perform ADB shell pm disable. You can see the messages in logs for detailed info about every disable. Once done, the disable operation is complete...

Enable

After you have connected to the watch, press the Disable/Enable button, skip the message about disabling apps, proceed and choose Enable. Select the apps you want to enable, and confirm...

Wait for the app to perform ADB shell pm enable. You can see the messages in logs for detailed info about every enable. Once done, the enable operation is complete...

Tips

- Some apps have safeguards against being disabled...
- Some system apps, if disabled, will cause the watch to crash and reboot into recovery. You will need to reset the watch if that happens...

And that's it for **How to Disable/Enable**!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything **I publish is completely free, with no ads**. So, your support is highly appreciated.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Geminiman

Video 6 – How to debloat and reinstall?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the sixth video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **How to debloat and reinstall**.

Usage

- Debloating apps is aimed at removing system apps that get turned on randomly after being disabled...

Starting

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

Debloat

After the watch is connected. Press the Debloat/Reinstall button. Choose Debloat, and select the apps you want to uninstall. Make sure you know what you are doing! After that you can either choose to uninstall only or save the uninstalled list before performing the uninstall. This is handy if you have a specific list of apps you want to always uninstall when you get a new watch or after you reset the current one...

Wait for the app to perform ADB shell pm uninstall. You can see the messages in logs for detailed info about every uninstall. Once done, the uninstall operation is complete...

Reinstall

After we connected to the watch. Press the Debloat/Reinstall button. Choose Reinstall, and select the apps you want to reinstall. Confirm...

Wait for the app to perform ADB install-existing. You can see the messages in logs for detailed info about every reinstall. Once done, the reinstall operation is complete...

Tips

- Some apps have safeguard against uninstallation due to some apps or services locking it...
- Some system apps, when uninstalled, will cause the watch to crash and reboot into recovery. You have to reset the watch if that happens...

And that's it for **How to debloat and reinstall!**

If this video was useful, please **leave a like**—it really helps out.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Geminiman

Video 7 – How to screen record?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the seventh video of **Geminiman WearOS Manager** tutorial collection.

It will focus on **How to screenrecord**.

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

After the watch is connected, make sure to keep the watch screen active. Not locked or turned off! This is due to google security of user consent. The recording will be blank if the screen is locked or off...

Now that the watch screen is on, press the start button, and screen recording will start. You can record up to 5 minutes. It is possible to stop the recording only after 10 seconds **have passed** (another requirement of screen recording). Once you are done, press the stop button. The app will perform an ADB pull for the recording and delete it from your watch...

And that's it for **How to screenrecord**!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything **I publish is completely free, with no ads**. So, your **support is highly appreciated**.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Video 8 – How to sideload apps - Normal Apk?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the eighth video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **How to sideload apps – Normal Apk**.

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

After the watch is connected, scroll down and select "install apk file". Navigate through the file manager and select the apk you want to install...

Wait for the app to perform ADB stream install. You can see the messages in logs for detailed info about the installation. Once done, the sideload operation is complete...

Tips

- ADB Error does not mean the app is not working. It means there is an issue with the apk. Simply copy the error and search on Google to understand the type of error and its solution...
- Some ported Apks might have a token, such as the Ultra Watchface. Tokenized apks cannot be installed and will throw an ADB Error. There is no straightforward workaround for tokenized apks that would not have problems...

And that's it for **How to sideload apps – Normal Apk**!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything **I publish is completely free, with no ads**. So, your **support is highly appreciated**.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Video 9 – How to pull apps?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the ninth video of **Geminiman WearOS Manager** tutorial collection.

It will focus on **How to pull apps**.

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

After the watch is connected, scroll down and select "pull apk from watch". Find the apk you want to pull and confirm.

Wait for the app to perform ADB pull. You can see the messages in logs for detailed info about the pull. Once done, the pull operation is complete. The apk will be pulled as a single or split apk. It depends on how it is installed on the watch...

Tips

- Split APK is pulled as a folder by default. If you want it pulled as a ZIP file, make sure you toggle that in the app settings...

And that's it for **How to pull apps**!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything I publish is completely free, with no ads. So, your support is highly appreciated.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Video 10 – how to install split apks/zip?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the tenth video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **how to install split apks/zip**.

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

After the watch is connected, scroll down and select "install split apks". You either select a split APKs/Zip file or multiple files (base.apk with split apk)...

Single File

In the file selector, find the APK or ZIP file that has your split apk. Select it and confirm...

Multiple Files

In the file selector, find all the apk files that belong to the split apk. Select them all and confirm...

Wait for the app to perform ADB stream install, and see the messages in logs for detailed info about the installation, once done, the split apk install operation is complete...

Tips

- Split apks are bundled, make sure you are installing the right bundle for your watch architecture to avoid ADB error related to that...
- Split apks consist of base apk, languages and libraries, if you don't install the entire bundle, you might encounter issues with the app...

And that's it for **how to install split apks/zip**!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything I publish is completely free, with no ads. So, your support is highly appreciated.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. See you!

Video 11 – How to run commands?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the eleventh video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **How to run commands**.

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

After the watch is connected, scroll down and simply type the command without "adb shell". You can also load an existing command and alter it. Once done, you can choose to run the command only or save it before running (it is useful when you want to run the same command frequently)...

Wait for the app to perform ADB shell. You can see the messages in logs for command response from success to errors. If the command does not run as expected, please reach out to me...

Tips

- You can run several commands, including pull command for a file
- If there is a command that does not work, do let me know and I'll see if the ADB binaries support it...

And that's it for **How to run commands**!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything I publish is completely free, with no ads. So, your support is highly appreciated.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Video 12 – How to start logcat?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the twelvth video of **Geminiman WearOS Manager** tutorial collection.

It will focus on **How to start logcat**.

Usage

- investigate why an app is crashing...

Starting

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

After the watch is connected, in the logcat tab, tap on the start logcat. You will see a prompt: "Start a clean log" or "Capture existing logs and add to it". A clean log is useful when you want to test an application and you have no interest in having previous logs. Existing logs are useful to find what caused the watch or app to crash...

Once you have selected what you want, the logcat will start running. Give the application some time to populate the logs. You can apply filters for the log if you wish to narrow down the logs (but I would advise to keep it all, as it helps in knowing if the app crashed due to a service or conflict with another app)...

Once you are done, you can hit stop logcat. You will be able to see the logs, search them or save them to be shared or viewed on PC or view them another time...

And that's it for **How to start logcat**!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything **I publish is completely free, with no ads**. So, your **support is highly appreciated**.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Video 13 – How to view existing logcat?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the thirteenth video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **How to view existing logcat**.

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

Viewing logs does not require you to connect to the watch. But you need gman logs (the logs created by Geminiman WearOS Manager). You will go to the logcat tab and tap on the load logcat. Select the logcat file that you wish to view, and explore it however you like...

And that's it for **How to view existing logcat**!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything I publish is completely free, with no ads. So, your support is highly appreciated.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Video 14 – What are the app settings?

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the fourteenth video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **What are the app settings**.

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

App Settings are used to export preferences (if you want to share it with friends or save as a backup). Or to import those preferences. As well there are few features that you can turn on or off. One of them is to pop up a dialog to turn off the ADB of your watch. Another one is automation related. It consists of auto export backups to downloads and auto compress split apks as a zip file when pulled. Finally, just as preferences, you can also import and export backups...

And that's it for **What are the app settings**!

If this video was useful, please **leave a like**—it really helps out.

If you have **any questions**. Feel free to drop a comment below or reach out to me on any of my **social media**. I'm more than happy to help!

If you're enjoying **Geminiman WearOS Manager**. Consider **sharing it** with your friends so more people can benefit from it.

Just a reminder—as a developer who dedicates free time to creating apps and watchfaces, everything I publish is completely free, with no ads. So your support is highly appreciated.

In the next video of the series, we will continue exploring everything **Geminiman WearOS Manager** has to offer. **See you!**

Video 15 – About permissions and support

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the fifteenth and last video of **Geminiman WearOS Manager tutorial collection**.

It will focus on **About permissions and support**.

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

Being a developer who values transparency, I want to share as much as I can about what permissions I used and why. So you can see and understand all of them and their role in the application.

As for the support, you have seen that all features are available with no ads or paywalls. And the project was created in September 2022 as an expansion of SHM MOD Companion by your request. I love to develop and create things whenever time allows it. That's why I would greatly appreciate it if you could support my work and any of my projects.

And that's it for **About permissions and support**!

And that it for the **Geminiman WearOS Manager tutorial collection**, have good day ~!

Video 16 – How to Use Custom Installer

Hello and welcome, everyone!

Dante here.

I hope you're all doing well.

This is the sixteenth video in **Geminiman WearOS Manager tutorial collection**.

It will focus on a new feature **How to Use Custom Installer**.

Before I start, just to be clear, I am using Samsung Dex, so my phone screen is on my computer screen...

So, let's dive right in!

Android WearOS uses a default installer for apk files when you use adb install command, however, if you want to use a custom installer with the adb install, simply go to Settings, and locate the Change installer section, and tap on Custom, now type in the installer you want to use, for example "com.android.vending" and click proceed. Now when you sideload any apk, the command will use the custom installer you specified instead.

If you wish to go back to default, simply go back to Settings, and in change installer, tap on the Default, this clears the custom installer, and the application will run adb install normally.

And that's it for **How to Use Custom Installer**!
